## **AIRSS** Take a set of atoms **RANDOMISE** With some sensible constraints Calculate the energy of the cell **RELAX** Move the atoms to local minima REPEAT Repeat until the lowest energy structures have been found multiple times **Genetic Algorithm** SEED Start with random or best guesses as initial popn. CROSSOVER Breed two structures by combining periodic cuts of each Generate new structures from the current generation **MUTATE** Randomly alter atomic species, positions or lattice COMPETE Relax structures with DFT and assess formation energies. Bring only the fittest structures through to the next generation REPEAT Repeat for several generations
